

ADVANCING MANAGEMENT OF GRASS BASED PASTURES

- ProGibb SG increases Dry Matter per ha
- ProGibb SG increases carrying capacity
- ProGibb SG reduces supplementary feeding

- ProGibb SG increases profitability from pasture
- No withholding period and no residues in either meat or milk

- ProGibb SG can be utilised in all pasture based systems including fat lamb, beef, dairy, equine, deer and goat operations

Holbrook NSW – Untreated (18 DAT)

Holbrook NSW – 10 g/ha (18 DAT)

Holbrook NSW – 20 g/ha (18 DAT)

Winter and spring are vital months for balancing pasture growth and providing quality feed for meat and milk production.

Sumitomo Chemical Australia Pty Ltd has trialed ProGibb SG in commercial situations since 2004 demonstrating increases in grass pasture production can be achieved during winter months.

ProGibb SG applied to pasture during winters coolest months will stimulate pasture growth and increases dry matter per hectare with no loss of feed quality (megajoules ME per kilogram of dry matter).

Visual responses following an application of ProGibb SG can be seen in 7 days and will provide accelerated growth for up to 3 - 4 weeks provided adequate soil moisture and nutrition is available.

APPLICATION

ProGibb SG can be applied to grass based pasture of at least one year old by conventional ground boom sprayer. Boom sprayers can be mounted on tractors, 4WD's, unimogs and quad bikes for small paddock applications. For full use instructions consult the ProGibb SG label leaflet.

COMPATIBILITY

The advanced formulation of ProGibb SG makes it compatible with a wide range of insecticides, herbicides, adjuvants and liquid nitrogen fertilisers. ProGibb SG can be mixed with dimethoate, Sumi-Alpha® Flex, omethoate, bifenthrin, Agral®, BS1000, Hasten™ and Maxx Organosilicone Surfactant™.

EASY N

No other formulation has been proven to be as compatible with liquid nitrogen fertilisers such as Easy N®. Trials have consistently shown that the use of ProGibb SG with Easy N liquid nitrogen fertiliser results in complementary and additional growth responses.

Herbicides

While ProGibb SG has been shown to be compatible with a wide range of herbicides, the timing of this application may not be ideal for best herbicide results. Ideally, weeds are controlled prior to ProGibb applications to maximise the pasture growth unhindered by weed competition. Additionally, the pasture should have been grazed immediately prior to ProGibb application, which may be less than ideal circumstances for optimum herbicide performance.

Extensive trial work has shown that ProGibb SG is compatible with herbicides 2,4-D, MCPA, simazine, Lontrel™, Tigrex®, Broadstrike™, Igran® and Brodal®. Some herbicides can cause a short term reduction in growth in pastures. ProGibb SG will not eliminate that effect, but will still provide an increase in dry matter compared to not using ProGibb.
