For the control of aphids, mirids and other sucking insect pests on cotton; rust thrips and weevil borer on bananas, and soil applied treatment for the control of canegrubs in sugarcane and leaf eating insects in Eucalypt seedlings and young trees.

GENERAL INSTRUCTIONS
INSECTICIDE RESISTANCE WARNING

For insecticide resistance management Sumitomo SHIELD Systemic Insecticide is a Group 4A insecticide. Some naturally occurring insect biotypes resistant to SHIELD and other Group 4A insecticides may exist through normal genetic variability in any insect population. The resistant individuals can eventually dominate the insect population if SHIELD or other Group 4A insecticides are used repeatedly. The effectiveness of SHIELD on resistant individuals could be significantly reduced. Since the occurrence of resistant individuals is difficult to detect prior to use, Sumitomo Chemical Australia Pty Ltd accepts no liability for any losses that may result from the failure of this product to control resistant insects. SHIELD may be subject to specific resistance management strategies. For further information contact your local supplier, Sumitomo Chemical Australia Pty Ltd representative or local agricultural department agronomist.

CROP MONITORING
Effective pest control depends upon regular monitoring of crops during the season at 3-5 day intervals.

MIXING
Measure the required amount of product to a partially filled spray tank and then add the remainder of the water. Ensure agitation is maintained during tank filling and whilst spraying. DO NOT let prepared spray solution sit in spray tank overnight.

COMPATIBILITY
It is advised to test water quality which may vary considerably with location, as well as all mixtures prior to mixing commercial quantities.

APPLICATION
Cotton: This product may be applied by air or ground equipment. Ground: Apply in a minimum spray volume of 100 L/ha. Aerial: Apply in a minimum spray volume of 30 L/ha. A strategy to minimize spray drift should be employed at all times when aerially applying sprays to, or near, sensitive areas. Such a strategy is illustrated by the cotton industry’s Best Management Practice Manual.

Bananas: This product may be applied by stem injection or stem spray. Stem Injection: Injection treatments should be applied at 150 mm above ground level angled downwards towards the base. The needle should go in 100 mm before being drawn back slightly and the liquid injected. The injection should be angled such that it is not in the centre of the plant but rather under the outside leaf base about 40 mm deep. No dilution is required. Chemical should not emerge from the injection site.

Stem Spray: The trunk spray should be applied with a full cone nozzle directed at the base of the stem and up to a height of 300 mm, so that it covers around 40% of that area of the stem. The spray should be calibrated so it delivers 10 mL of mixture per stem. DO NOT spray on to old leaf bases. Ensure the stem is still green where the spray is applied.

Sugarcane
Plant cane: Application can only be done at late planting (Oct. – Dec.) or during fill in stages. SHIELD should be applied in a minimum of 100 L water /ha. At late planting: (October – December): The planter should be set so that 30 – 50 mm of soil covers the sets as they enter the ground. Direct the
spray nozzles on the planter so that they spray a band approximately 10 cm wide on soil that has just covered the sets. The planter boards need to be adjusted so that a further 50 mm of soil covers this spray band immediately. Later cultivation should not be to a depth that disturbs the treated band. There should be at least 100 mm of soil cover over the treated layer after the final hilling up operation.

At fill in stages: Once the cane has germinated and there are a number of leaves above the ground it is generally necessary to apply two directed spray bands about 50 mm wide from the sides of the cane plants onto the soil at the base of the cane shoots. This is to ensure that the chemical spray does not hit the leaves. The treated bands should then immediately be covered with at least 50 mm of soil. Later cultivation should not be to a depth that disturbs the treated band. There should be at least 100 mm of soil cover over the treated layer after the final hilling up operation.

**Ratoon cane:** Apply in at least 100 L water/ha by injecting behind coulters that cut into the soil. Soil should have moisture at coulter depth at the time of application or receive at least 15 mm of irrigation within a week. Ensure that the coulter slits fill in after treatment and the chemical is at least 100 mm below the surface of the stool mound.

**Twin coulter method:** Apply subsurface behind twin coulters at a depth of 100 – 150 mm. Coulters should be spaced 310 – 500 mm apart on either side of the stool. They should be as close as possible within this range but wide enough to avoid excessive stool damage particularly in advanced cane.

**Single coulter method (stool split):** Apply subsurface behind a single coulter in the centre of the stool at a depth of 100 – 125 mm. **DO NOT** use this method if ratoon growth is advanced or the stool is of a variety such that excessive crop damage may result.

**PROTECTION OF LIVESTOCK**
Dangerous to bees and will kill bees foraging in the crop to be treated or in hives which are over-sprayed or reached by spray drift, and residues may remain toxic to bees several days after application.
Risks to non-target insects – Clothianidin may have adverse effects on some non-target beneficials, in particular where IPM is practiced, to foliage dwelling predators.

**PROTECTION OF WILDLIFE, FISH, CRUSTACEANS AND ENVIRONMENT**
**DO NOT** apply under weather conditions, or from spraying equipment, that may cause spray drift onto nearby or adjacent areas, particularly wetlands, waterbodies or watercourses. This product is highly toxic to aquatic invertebrates. **DO NOT** contaminate streams, rivers or waterways with the chemical or used containers. **DO NOT** apply when there are aquatic and wetland areas including aquacultural ponds or surface streams and rivers downwind from the application area and within the mandatory no-spray zone shown in table 1.
STORAGE AND DISPOSAL
Store in the closed, original container in a dry, cool, well-ventilated area, away from direct sunlight.
Triple or preferably pressure rinse containers before disposal. **DO NOT** dispose of undiluted chemicals on site. If recycling, replace cap and return clean containers to recycler or designated collection point.
If not recycling, break, crush or puncture and deliver empty packaging to an approved waste management facility. If an approved waste management facility is not available bury the empty packaging 500 mm below the surface in a disposal pit specifically marked and set up for this purpose clear of waterways, desirable vegetation and tree roots, in compliance with relevant Local, State or Territory government regulations.
**DO NOT** burn empty containers or product. For refillable containers: Empty contents fully into application equipment. Close all valves and return to point of supply for refill or storage.

IMPORTANT NOTICE
These goods are to be used only for the purpose and as specified on the label, and are not suitable for any other purpose. To the fullest extent permitted by law, we do not accept or bear any liability on any basis for any loss, damage, cost or expense, arising in any way, directly or indirectly, in connection with the goods.

APVMA Approval No.: 60689/51118

SAFETY DATA SHEET
Additional information is listed in the Safety Data Sheet (SDS) obtained from Sumitomo Chemical Australia Pty Ltd.

DIRECTIONS FOR USE:
RESTRAINTS:
SPRAY DRIFT RESTRAINTS
**DO NOT** apply with droplets smaller than a MEDIUM spray droplet size category according to nozzle manufacturer specifications that refer to the ASAE S572 Standard or the BCPC Guideline.
**DO NOT** apply when wind speed is less than 3 or more than 20 kilometres per hour as measured at the application site.
**DO NOT** apply during surface temperature inversion conditions at the application site.

Users of this product MUST make an accurate written record of the details of each spray application within 24 hours following application and KEEP this record for a minimum of 2 years. The spray application details that must be recorded are:
1. date with start and finish times of application;
2. location address and paddock/s sprayed;
3. full name of this product;
4. amount of product used per hectare and number of hectares applied to;
5. crop/situation and weed/pest;
6. wind speed and direction during application;
7. air temperature and relative humidity during application;
8. nozzle brand, type, spray angle, nozzle capacity and spray system pressure measured during application;
9. name and address of person applying this product.

(Additional record details may be required by the state or territory where this product is used.)

MANDATORY NO-SPRAY ZONES
**DO NOT** apply if there are aquatic and wetland areas including aquacultural ponds, surface streams and rivers downwind from the application area and within the mandatory no-spray zones shown in Table 1

| Cotton             | Cotton aphid                      | 125 - 250 mL/ha plus MAXX Organosilicone SurfactantTM at 2 mL/L of water. | **DO NOT** apply more than 2 sprays per season and these should alternate with a pesticide from a different group.  
**Aphids**  
Apply when aphid numbers are low but starting to build. For example, before there are more than 2 leaves per plant with honeydew.  
**Mirids, Jassids, Green Vegetable Bug**  
Regular pest monitoring is necessary to determine pest numbers. Apply when numbers reach threshold levels requiring treatment.  
**For all Insect Pests**  
Use the higher rate when heavy infestation is expected and longer control is required. Treated insects may still be on the plant 2 or 3 days after application but will have stopped feeding. |
| Banana             | Weevil borer                      | Stem Injection 3 mL per pseudostem injected at the base. | It is recommended that SHIELD is not applied in consecutive crop cycles but rather alternated with a product from a different group to reduce the possibility of rust thrips developing resistance.  
**DO NOT** apply the stem spray application to bananas if rain is expected within 24 hours.  
**Timing**  
Apply to pseudostem of the main daughter plant when it is a height of 1.5 m to the base of the central cigar leaf, preferably within one month of the bunch on the mother plant being harvested.  
**Stem Injection**  
Injection should be angled such that it is not in the centre of the plant but rather under the outside leaf base about 40 mm deep. See Application section for further information.  
**Stem Spray**  
Ensure the stem spray is applied to green growing stem. See Application section for further information. |
| Sugarcane (plant cane) | Greyback canegrub (Dermolepida bohiritum) | 2.5 L/ha. This applies to dual row planting as well. (equivalent to 38 mLs per 100 m of single row cane with a 1.52 m spacing) | **DO NOT** apply as a foliar application.  
**DO NOT** apply more than one soil application of SHIELD per crop per season.  
Apply as a band spray on late plant or during fill-in stage between the months of October to December. In dual rows the amount required per hectare should be split and applied to both rows  
Refer to APPLICATION directions under GENERAL INSTRUCTIONS  
**Stem Injection**  
Use the high rate where higher pressure is expected (more than 2 grubs/stool) to fields at high risk of greyback damage. Apply while the stools are small enough to avoid excessive damage. This is generally from October to December. In areas where early beetle flights occur application should be made early in this period.  
Apply as a subsurface soil application with coulters. Refer to APPLICATION directions under GENERAL INSTRUCTIONS. |
| Sugarcane (ratoon cane) | Greyback canegrub (Dermolepida albohiritum) | 1.75 – 2.5 L/ha (equivalent to 27 – 38 mL per 100 m of cane row with a 1.52 m spacing) | **DO NOT** apply as a foliar application.  
**DO NOT** apply more than one soil application of SHIELD per crop per season.  
Use the high rate where higher pressure is expected (more than 2 grubs/stool) to fields at high risk of greyback damage. Apply while the stools are small enough to avoid excessive damage. This is generally from October to December. In areas where early beetle flights occur application should be made early in this period.  
Apply as a subsurface soil application with coulters. Refer to APPLICATION directions under GENERAL INSTRUCTIONS. |
| Childers canegrub (Antitrogus parvulus) | 1.25 – 1.75 L/ha (equivalent to 19 – 27 mL per 100 m of cane row with a 1.52 m spacing) | Monitor for the presence of grubs starting in September and apply immediately grub numbers reach an economic threshold (about 3 grubs/stool). Early application will be more effective than late.  
Use the high rate when grub populations are high (e.g. an average of more than 5 grubs/stool) or if application is after damage has become visible.  
Refer to APPLICATION directions under GENERAL INSTRUCTIONS. |

<tbody>
<tr>
<td>Eucalypt seedlings from planting to 1 year old</td>
<td>Leaf feeding beetles: Including: <em>Paropsisterna agricola</em> <em>Cadmus australis</em> <em>Liparetrus jenkinsi</em> <em>Heteronyx dimidiata</em> and other <em>Heteronyx</em> species.</td>
<td>Subsoil seedling injection adjacent to root ball. 1.25 mL per seedling at or soon after planting - mixed with water to a total volume of 5mL. Where severe pest pressure is expected: 2.5 mL per seedling at or soon after planting - mixed with water to a total volume of 5mL.</td>
<td>Apply by injection about 2 cm below or to the side the seedling root ball at or soon after planting. DO NOT apply Shield directly to the root ball area as this may affect plant growth. The speed of control from this application depends on how fast the product is taken up by the seedling, which needs to be actively growing. This will be assisted by post-planting rainfall or watering of at least 10mm. It is recommended that application is before or during the main annual rainfall period. If severe attack takes place prior to the chemical becoming effective in the plant, a knockdown insecticide may be required to give short term protection.</td>
</tr>
<tr>
<td>Eucalypt trees from 1 to 5 years old in the height range 0.5 to 8m</td>
<td>Psyllids: Including: <em>Creis lituratus</em> Leaf feeding beetles Including: <em>Paropsisterna</em> species Leaf feeding weevils Including: <em>Goniipetes scutellatus</em></td>
<td>Subsoil side dress application: 2.5 - 10 mL per tree mixed with water for a total volume of at least 40mL/tree. Suggested rates based on tree height. In general the larger the tree and the higher the insect pressure the higher the rate required.</td>
<td>Apply when monitoring of adult flights and field populations of eggs, larvae or nymphs indicate that an economically damaging population is expected. Because it may take several weeks for the chemical to be taken up and become effective it is recommended that application is done by looking at the pest pressure on an area wide basis and treating high risk sites prior to infestation. Application should be by subsoil injection 10 – 15 cm deep and in a continuous line 20 - 40 cm from the tree trunks parallel to the row. This is normally on the outer edge of the mounded area. All weeds out to 65 cm from the tree trunk should be controlled by knockdown and residual herbicide application to avoid them taking up the chemical. The speed at which treatment becomes effective depends on how fast the product is taken up by the tree, which needs to be actively growing. Uptake will be assisted by post-treatment rainfall which soaks down into the root zone. Generally this requires least 25 mm of rain in a single event. It is recommended that application is before or at the start of the main annual rainfall period. Long term water logging may also inhibit chemical uptake and tree growth. If severe attack takes place prior to the chemical becoming effective in the plant, a knockdown insecticide may be required to give short term protection. Treatment of trees at one to two years of age is recommended since this reduces the rate required and gives the trees protection at the time when they are most vulnerable.</td>
